

Link Redundancy

Objectives:

At the end of this episode, I will be able to:

1. Describe the redundant interface concept and describe when it would be used with a Firepower device
2. Describe the options for EtherChannels that are possible on Firepower devices

Additional resources used during the episode can be obtained using the download link on the overview episode.

Remember:

- The redundant interface type is a holdover from the ASA; it is only possible on an ASA with a Firepower module
- The redundant interface is a logical interface that is made up of a physical standby interface and a physical active interface
- Fortunately, Firepower devices themselves (not inserted into an ASA) can do EtherChannels for redundancy and added bandwidth
- LACP and static mode configurations are both supported

External Resources:

During this episode, you can reference the following external resources for supplementary tools and information:
