Module agenda

Provide apps to users

Manage Universal Windows Platform apps

Manage the Microsoft Edge browser

Explore the Windows servicing model

Update Windows clients

Lesson 1: Provide apps to users

Lesson 1: Provide apps to users

- Explore types of Windows apps
- Examine methods for deploying desktop apps
- Install desktop apps manually
- Automate desktop app installation
- Install Microsoft 365 apps

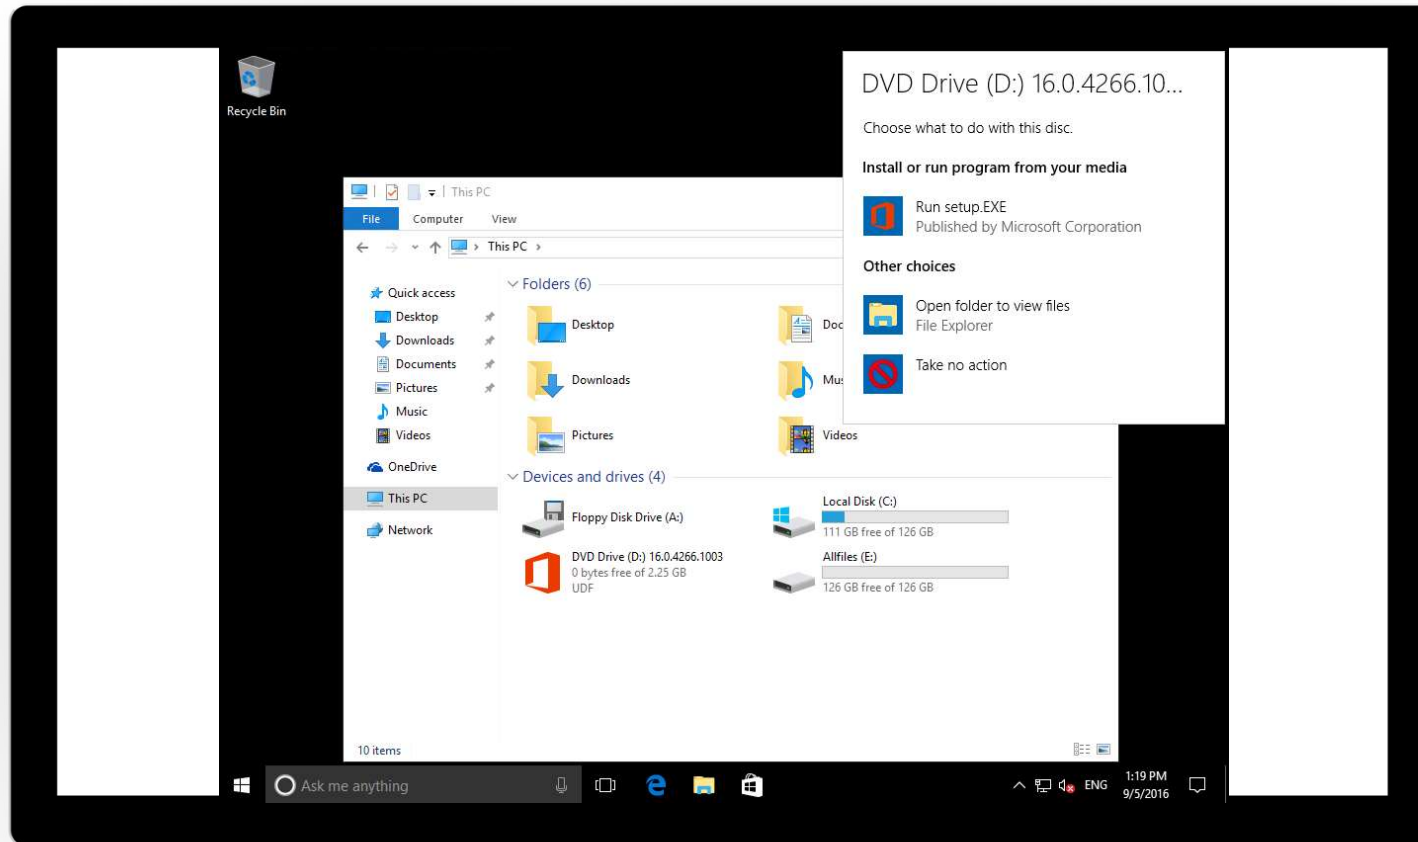

Explore types of Windows apps

- Desktop app installation:
 - Is performed by using .exe or .msi installer files
 - Can be automated
 - Can be replaced by distributed app installation and execution methods in larger environments
- Microsoft Store apps:
 - Run on Windows 8.1 or newer
 - Can be installed from the Microsoft Store or sideloaded
- Universal Windows Apps
 - Can install on multiple hardware platforms
 - Desktop Bridge can convert desktop apps to universal app
- RemoteApp apps:
 - Enable apps to run remotely but display locally
 - Enable apps to run on clients that do not meet app hardware requirements
- App-V apps
 - Apps stream to the desktop
 - Enable multiple versions of apps to run without conflict

Examine methods for deploying desktop apps

- Manual installation
- Group policy
- Microsoft Endpoint Configuration Manager
- Microsoft Intune
- Virtualized applications
- Remote applications
- Included in image

Install desktop apps manually

© Copyright Microsoft Corporation. All rights reserved.

Automate desktop app installation

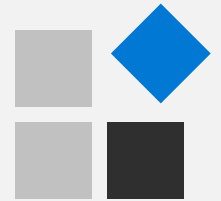

Tool	Advantages	Disadvantages
Group Policy	• Leverages existing AD infrastructure • Low Complexity	• Requires domain-joined • Must be MSI • Very limited reporting (event log) • No pre-req verification
MDT	• Light-touch solution • Minimal infrastructure requirements	• Strictly for deployment, not a full management solution
SCCM	• Comprehensive Management • Zero-touch solution (when combined with MDT)	• More complex to deploy and manage • Devices must be managed by organization • Doesn't support mobile OSes
Intune	• Comprehensive Management • Low Complexity • Supports BYOD and mobile OSes	• Cannot deploy OS (uses Autopilot) • Limited Win32 app deployment capabilities • Not as robust as SCCM

Install Microsoft 365 apps

- Deployment Options
 - Click-to-run
 - Group Policy
 - Configuration Manager
 - App-V
 - Remote Desktop Service (RDS)

Knowledge Check

Lesson 2: Manage Universal Windows Platform apps

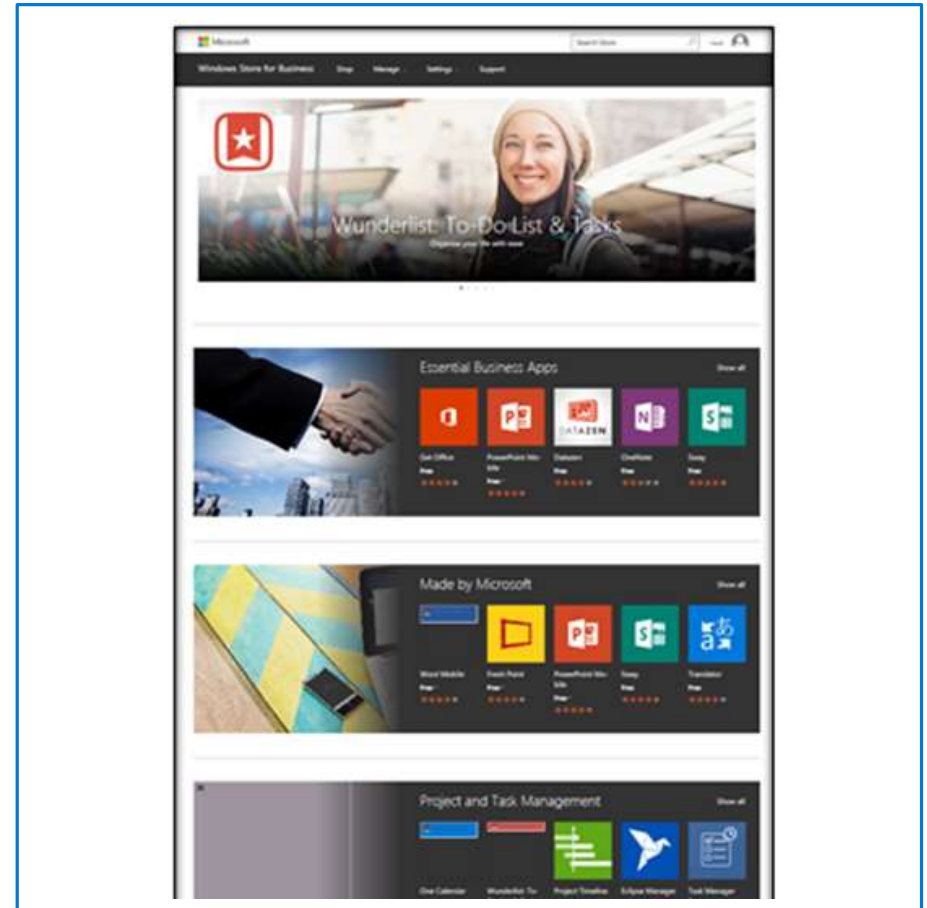

Lesson 2: Manage Universal Windows Platform apps

- Compare Microsoft Store and Microsoft Store for Business
- Manage access to Microsoft Store apps
- Configure assigned access to a single store app

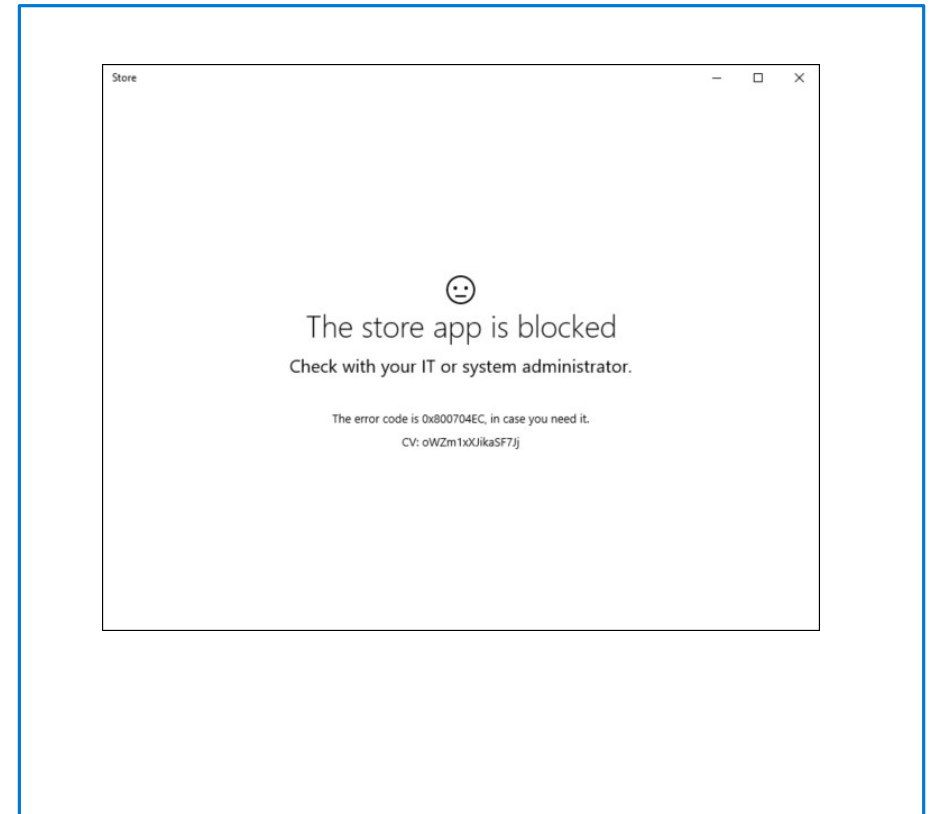

Compare Microsoft Store and Microsoft Store for Business

- Microsoft Store for Business is a portal that provides users access to corporate apps
- Organizations must have an Azure AD tenant
- Apps can be purchased from the store for individuals or in volume for the organization
- Apps are only supported on Windows 10 devices
- Organizations can house their LOB apps in a private store
- Developers can be allowed to upload custom apps for your organization

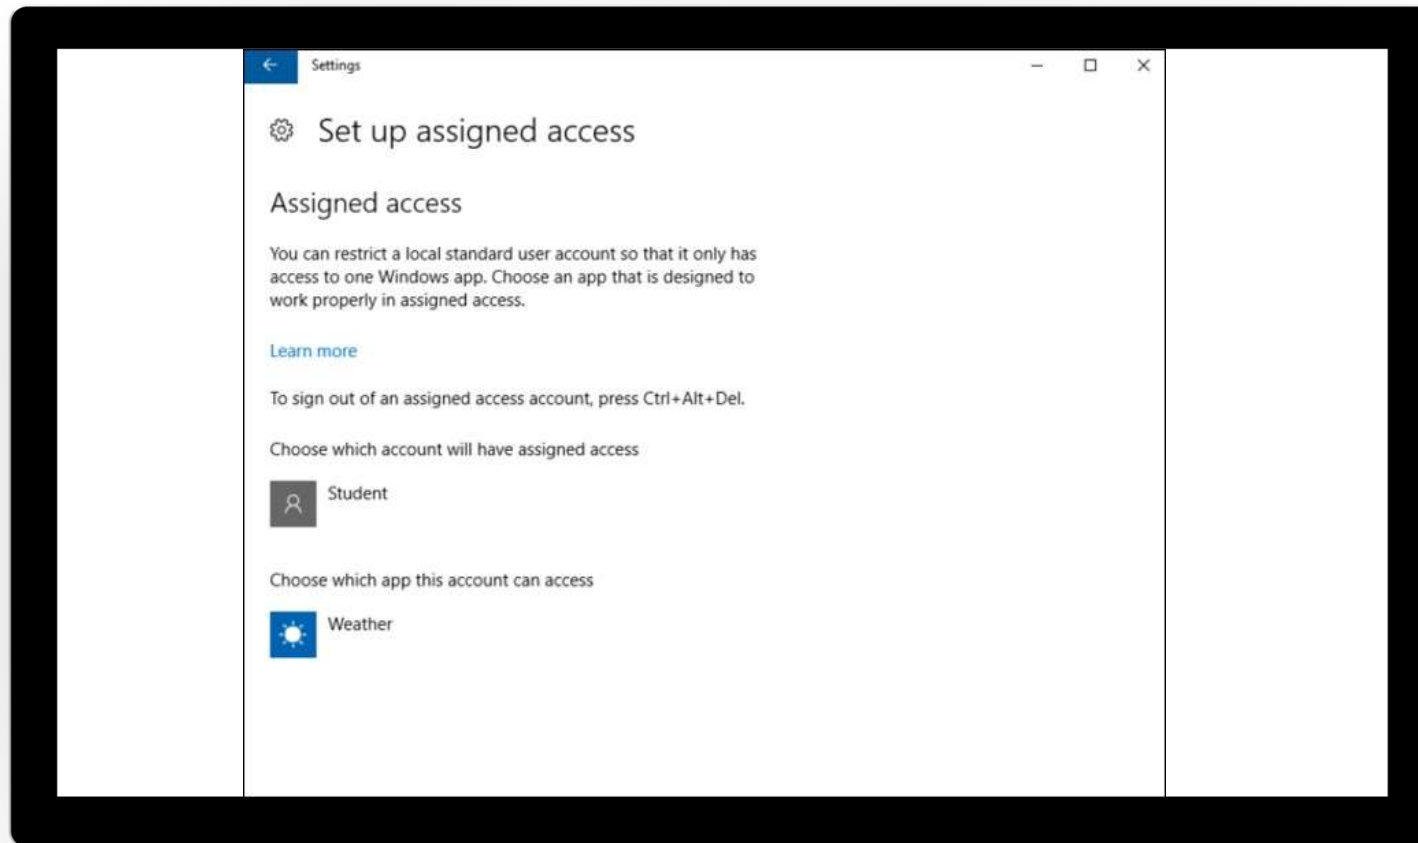

Manage access to Microsoft Store apps

- Users must sign in with a Microsoft account to download apps
- Preventing access to the Windows Store requires:
 - Editing the registry OR
 - Blocking Microsoft accounts
- AppLocker can control installation and execution of certain apps from the Microsoft Store
- App updates are installed automatically by default

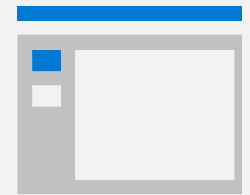

Configure assigned access to a single store app

Knowledge Check

Lesson 3: Manage the Microsoft Edge browser

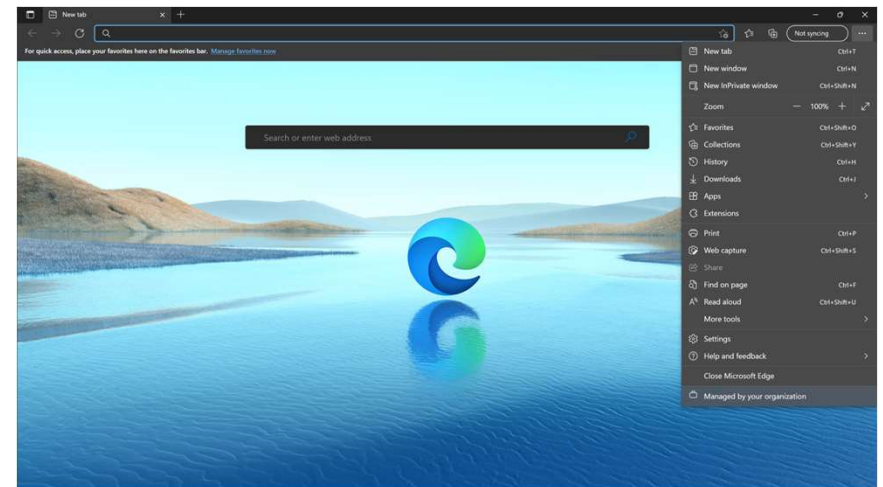

Lesson 3: Managing the Microsoft Edge Browser

- Examine the Microsoft Edge browser
- Configure Microsoft Edge
- Examine privacy features in Microsoft Edge
- Manage Microsoft Edge extensions
- Implement Internet Explorer mode
- Explain Microsoft Edge Insider channels
- Troubleshoot common Microsoft Edge issues

Examine the Microsoft Edge browser

- **Notable features**
 - Tab management
 - Collections
 - Synchronization of settings
 - Switch Profiles
 - Paste and go
 - Web notifications
 - Reading view
- **Improvements**
 - Based on Chromium
 - Faster sign in to sites compatible with Windows Hello
 - Improved HTML5 compatibility, battery life, security

Configuring Microsoft Edge

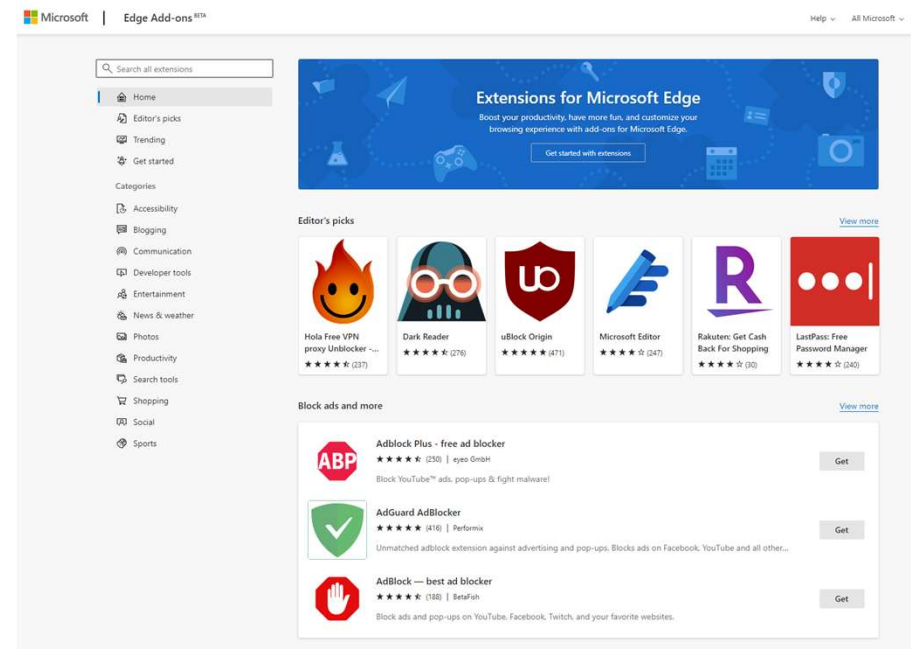

- **Install administrative templates**
 - msedge.admx: Edge settings
 - msedgeupdate.admx: Edge updates
- **Set policies**
 - Mandatory policies cannot be changed by users
 - Recommended policies define default settings that can be changed by users
 - Some policies only have one option
- **Verify policies**
 - edge://policy

Examine privacy features in Microsoft Edge

- **InPrivate browsing**
 - Does not retain history, temporary files, form data, cookies, passwords
 - Useful for wishing to sign in with alternate credentials
- **Tracking protection**
 - Configure level of tracking – Basic, Balanced, Strict
 - Can interfere with how some websites may work
- **Clear browsing data**
 - Select what history to clear
 - Useful for troubleshooting, cleaning up space, compliance

Manage Microsoft Edge extensions

- **Extend functionality of the browser, websites and web applications**
 - Translation
 - Password management
 - Ad blocking
 - Page analyzers
- **Install extensions**
 - From Microsoft Edge Add-ons
 - Other stores that support chromium browsers

Implement Internet Explorer mode

- **Internet Explorer retiring in 2022**
 - Some legacy sites still require Internet Explorer
 - Poor experience switching between browsers
- **IE Mode**
 - Renders legacy IE sites in Microsoft Edge
- **Enterprise Mode Site list**
 - XML file with defined list of sites that require IE Mode
 - Seamless experience for user
 - Create list using *edge://compat/SiteListManager*
 - Deploy list using policy

Explain Microsoft Edge Insider channels

- Allow for previewing future builds of Edge
- Separate installs, can run side-by-side
- Use Target Channel override policy for selective groups

Channel	Primary purpose	Update cycle
Stable	Broad deployment	Every ~4 weeks
Extended Stable	Aligned to a longer release cycle	Every ~8 weeks (even numbered builds)
Beta	Validating the next build	Every ~4 weeks
Dev	Next beta release	Updated weekly
Canary	Bleeding edge content	Updated daily

Troubleshoot common Microsoft Edge issues

Common Issues

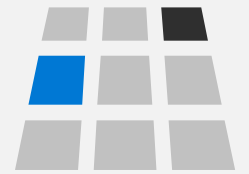

- Pages load slow or missing objects
- Sites behave incorrectly
- Missing favorites
- Text size issues

Common solutions

- Clear Cache, InPrivate
- IE Mode
- Check Microsoft Edge Sync
- Check missing/unreliable extension
- Adjust font size

Knowledge Check

Lesson 4: Explore the Windows servicing model

Lesson 4: Explore the Windows servicing model

- Examine the Windows servicing model
- Explore the Windows client servicing channels
- Examine Windows Update options

Examine the Windows servicing model

Feature updates	A new Windows release that contains additional features and capabilities, released two to three times per year.
Quality updates	In Windows 10 and later, rather than receiving several updates each month and trying to figure out which the organization needs, which ultimately causes platform fragmentation, administrators will see one cumulative monthly update that supersedes the previous month's update, containing both security and non-security fixes.
Channel	The windows servicing channel is one of three choices: Windows Insider, Semi-Annual Channel/ General Availability Channel, or Long-Term Servicing Channel. Channels allow customers to designate how frequently their individual devices are updated.
Ring	These are simply a method by which to separate machines into a deployment timeline. Examples of Windows servicing rings could be Preview, Targeted, Broad, and Critical.

Explore the Windows client servicing channels

Servicing option	Application	Availability
Windows Insider Program	Preview feature updates before they are released to the Semi-Annual Channel	All the main editions of Windows 10/11
General Availability Channel	Feature updates available immediately after publication	All the main editions of Windows 10/11
Long-Term Servicing Channel	Long-term deployment of selected Windows 10 releases with minimal feature updating	Only available on the Enterprise LTSC edition of Windows 10

Examine Windows Update options

Servicing Tool	Can updates be deferred?	Ability to approve updates	Peer-to-peer option	Additional features
Windows Update	Yes (manual)	No	Delivery Optimization	None
Windows Update for Business	Yes	No	Delivery Optimization	Other Group Policy objects
WSUS	Yes	Yes	BranchCache or Delivery Optimization	Upstream/downstream server scalability
Microsoft Intune	Yes	Yes	Delivery Optimization	Cloud-based Management
Configuration Manager	Yes	Yes	BranchCache, Client Peer Cache	Distribution points, multiple deployment options

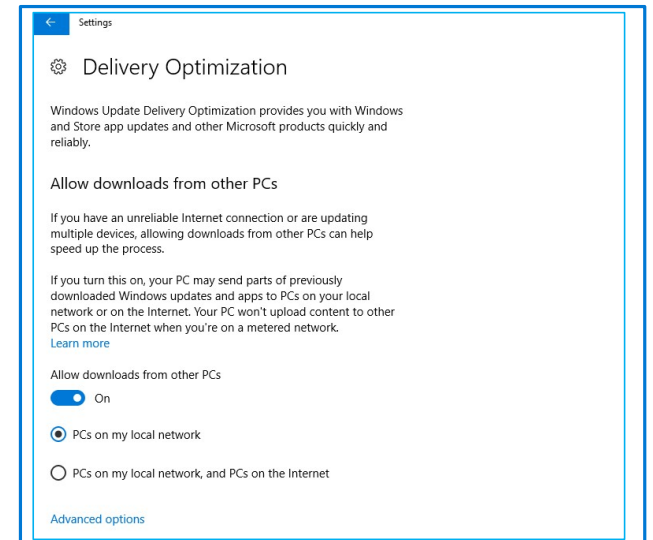

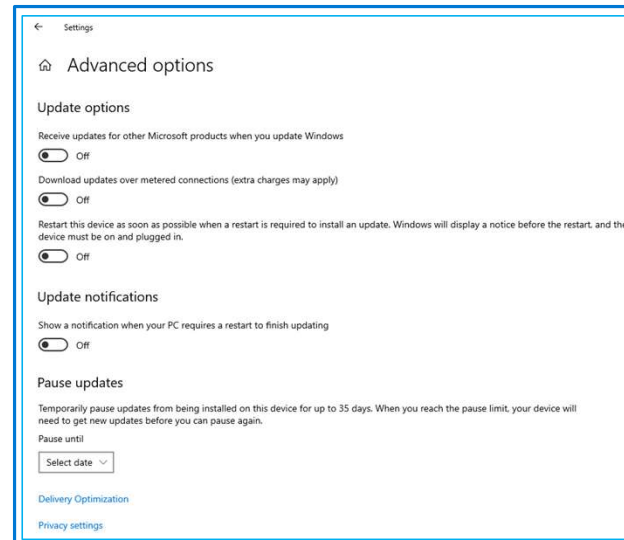

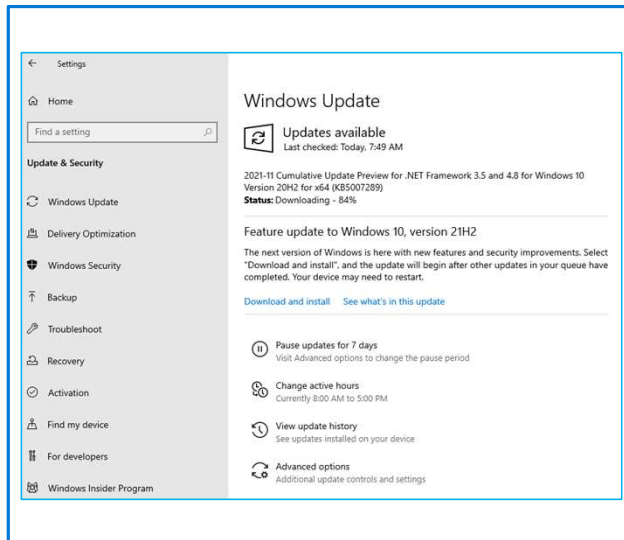

Lesson05: Update Windows clients

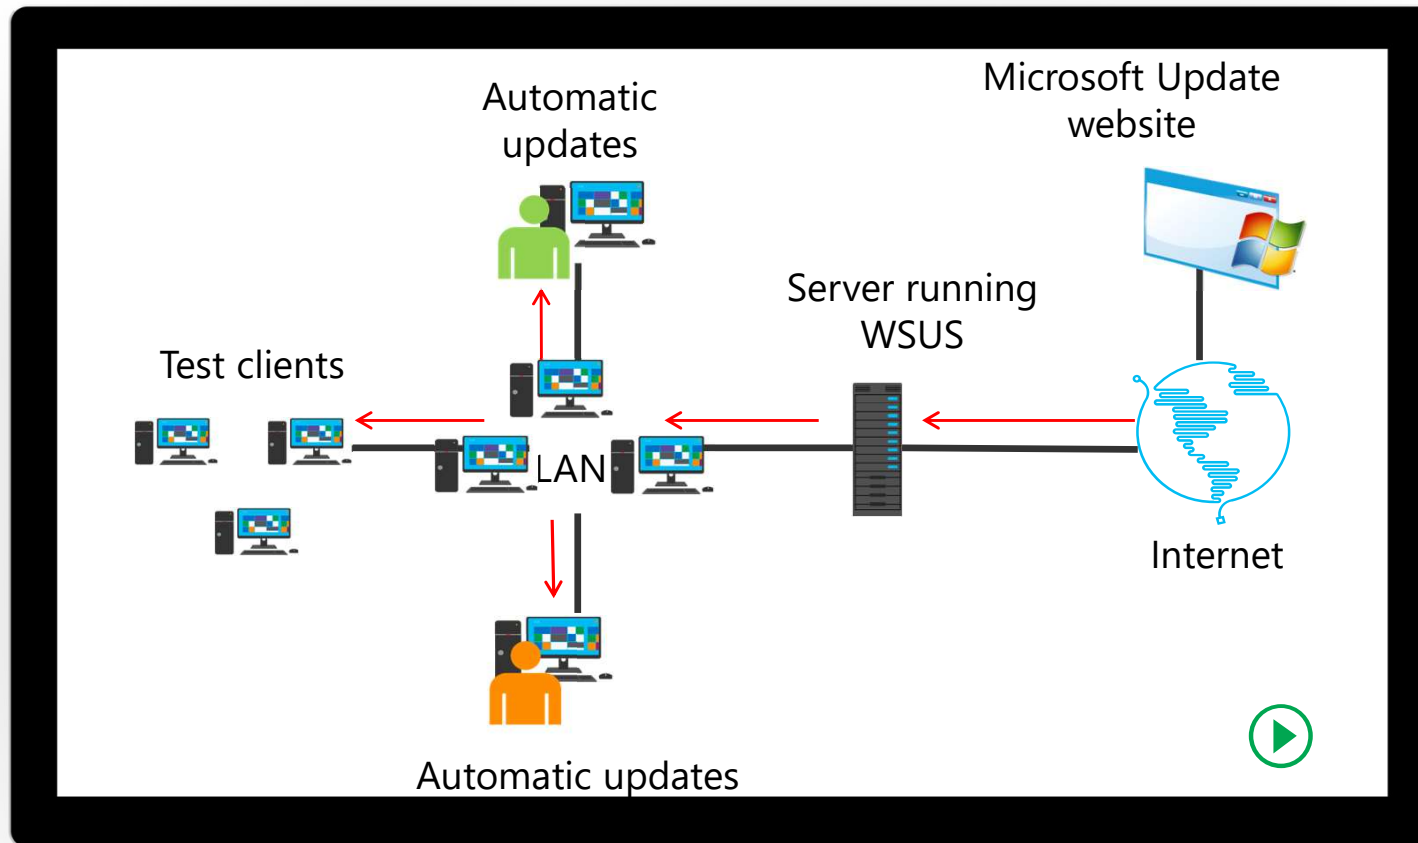

Lesson 5: Update Windows clients

- Examine Windows Update settings in Windows clients
- Use a WSUS server to deploy updates
- Update clients using Windows Update for Business
- Use Group Policy settings to configure Windows Update
- Troubleshoot Windows updates

Examine Windows Update settings in Windows clients

Use a WSUS server to deploy updates

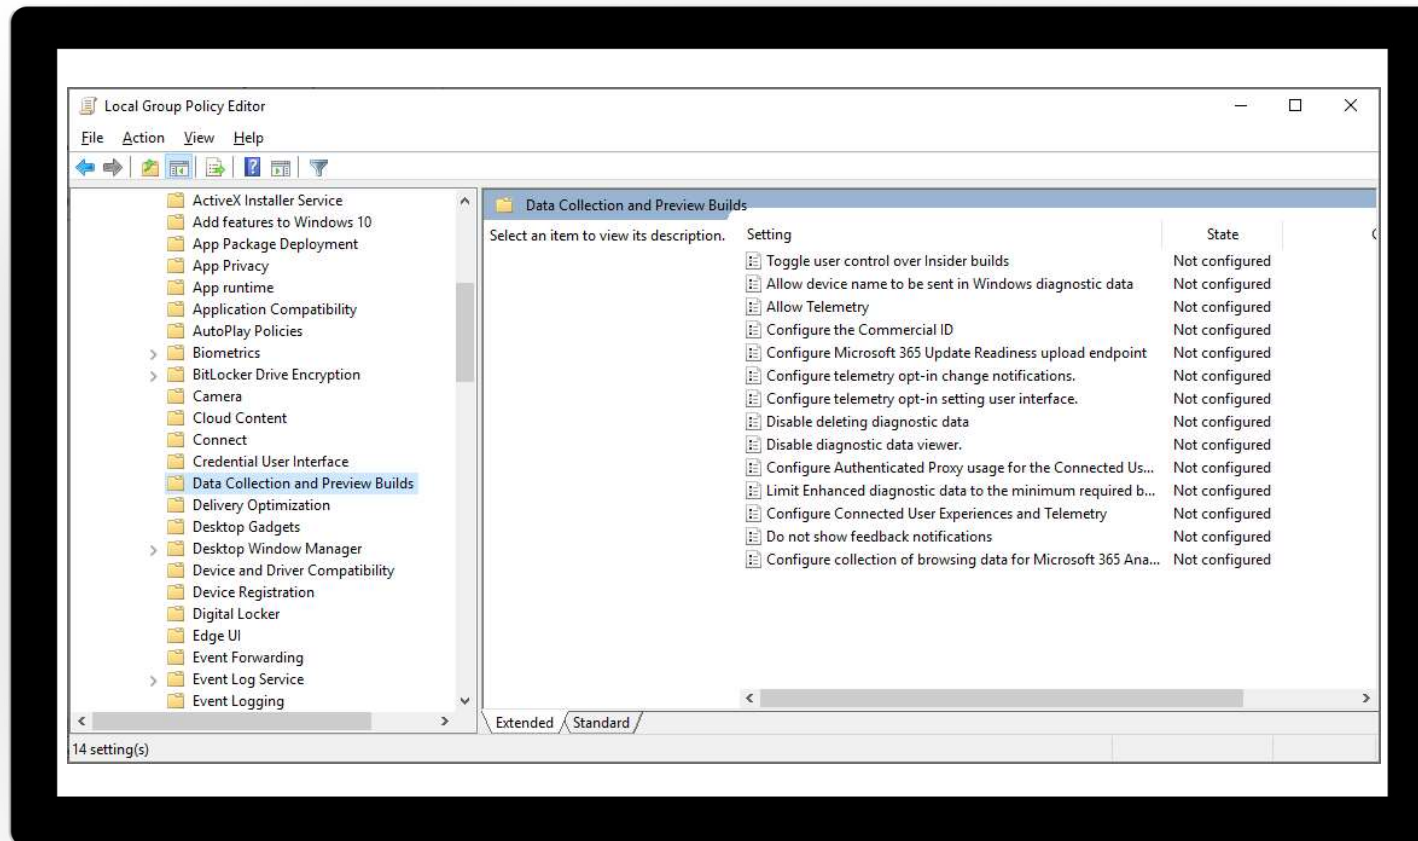

Update clients using Windows Update for Business

Windows Update for Business delivers updates differently than WSUS, and has the following characteristics:

- Distribution rings
- Deferring updates:
 - Quality Updates. Defers updates up to 30 days and pauses for up to 35 days
 - Feature Updates. Defers updates up to 365 days and pauses for up to 35 days
 - Drivers. Excludes drivers from updates
- Maintenance windows
- Delivery optimization
- Integration with:
 - Endpoint Configuration Manager
 - Microsoft Intune

Use Group Policy settings to configure Windows Update

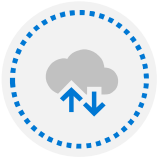

Troubleshoot Windows updates

Test Windows Updates first

- Windows Insider
 - Deployment ring
